alive-hunter.io Q: Can generalists be trained to be specialists? Much is written about the oversupply of software engineers. We're told that companies are struggling to find good engineers to fill their software engineering positions, and that they're having to pay large sums of money to train up graduates to become software engineers instead of hiring less experienced ones. I have heard that this is because of the mistaken belief that a specialist who has experience in one area (e.g. Java) can be trained to solve a wide array of problems in a few weeks, resulting in a higher quality solution. However, my understanding of generalism is that it's possible to gain just as much experience in a broad area, despite not having dedicated time to gain that experience. My understanding of generalism comes from studying maths, where you learn broad ideas, and then picking and choosing a specialisation where you would like to gain skills. Is this correct, and if so, what is a good example of a situation where a good generalist can become a great specialist? Or, are people saying that generalists are good, but the idea is that the generalists need to specialise quickly and buy up their experience before being able to dedicate as much time as a specialist? A: A bit of a radical point of view, but if you take a look at this TED talk, it might help you understand what is meant by the so-called generalism. However, the idea you mentioned seems to be more about specialization: "so let's be super-specialized in one thing so we can quickly become really good at it and never have to play small ball on any other side." A: First, I would say that being a generalist is one of the most important jobs in software development. It doesn't mean you can't be very strong in one thing. It means you understand the subject and know where to find the experts. Second, as far as training goes it's not a necessary adjunct to generalism. If you understand the subject and know where to find the experts, you're pretty well set. Third, unless you're a senior engineer in a large organization, the time you dedicate to being a generalist, or even any specialist for that matter, isn't going to be that much. From my experience, spending an hour or two a day just thinking and talking about new technologies is much more productive than having a whole

Gameplay is as measured as it is expedient. Avoiding enemy fire comes first. Rushing in to do a one-hit wonder or taking the far less effective approach of sprinting behind a cover isn't usually rewarded. Getting spotted is a real problem, so you'll spend a lot of your time crouching behind cars or moving slowly, shooting the crap out of anything that moves. Enemies have a fair chance of seeing you too, so keep to the shadows. Combat is heavily weighted toward physics-based aggression. Sometimes this means you'll walk into an explosive brick wall. Other times it means you'll get obliterated by the black hole of a door in a corridor. It's your job to avoid this stuff – and not just because you'll die horribly if you walk into an explosion. It's there to make the game more difficult and you shouldn't really be punished for accidentally walking into it. The way you progress through the game is to identify cover and then carefully navigate a careful way through the environment. Cover has five purposes: to give you an advantage over the enemy, to offer you a little room for a hit-and-run move, to provide a way to shoot back, to offer you a sniping position, and to offer you the option to barricade yourself from the enemy. If your cover is compromised, that might mean the window has been blown out or the door has been blown in. When a door or window is blown in, this means that a window has been opened. From a shooter's perspective, an open window is the easiest thing in the world to hit. It's a window. It's obviously a door. It's big and white and round. It's not moving. It's not doing anything to disguise your intended target. It's begging you to shoot it. It's begging you to use it as a shooting position, a retreat position, a way to force the enemy to take cover, or to set up a sniping position. It's begging you to blow it in. And when a door is blown in, that means that there's room for an enemy to have gone through. They can come out from the other side. They can come out from a room behind that door. They can come through from a window. There's a reason the game is called The Signal From

Q: How to release a file no matter where I'm using it? I have a large code I have written in Java and I find myself using a part of this code often, and it relies heavily on this file. Since this Java application is very large, I would like to get a hand in my file either releasing it from my end, or sending it off. If I just dumped and sent it through the Java code (fully, not a single line), it could stay there forever, eating more and more disk space. Is there a way to get a chance to either release it, or at least delete it on my end? Should I post the whole app somewhere? Is there a service that would take time reading over it and tell me, "okay you're doing it wrong here", or "Why don't you do this better"? A: You could try using ANT Taxpayers and Labour voters to set their faces against housing price ‘scam’ Share The campaign to bring back the stamp duty basic rate that
