'getStations' calls completes. Note: I cannot get the time to execute some other function because of the data is returned and the nextTick of the 'getStations' is not possible as it returns Observable. A: From what you are saying I gather that you want the 'status' of all the stations to be emitted at once, but you don't seem to know what Observable that should be, so here is an example of how that would work if you wanted it to happen now.

```
getStatus(id: number): Observable { return this.getStations().map(data => data.filter(data => data.stationId === id)).map(data => data.status); } const status$ = this.getStatus(11).map(status => status);
```

When calling status\$, you can assign it to a variable to handle the value, do whatever you need to do with it, then assign the 'status\$' variable to something else if needed. Hope this helps. Q: Gradient

Multiloop Beta Trapped Enzyme-
catalyzed Synthesis of Styrene Oxide
from Styrene C6-oxidoreductase: Kinetic
studies and stereospecificity of the
enzyme. Styrene oxide, a versatile and
biologically important epoxide, is
synthesized from styrene by styrene-
oxidizing enzymes. In this work, we
report the systematic studies of the role
of the enzyme species in the multiloop
beta-trapped enzyme-catalyzed
synthesis of styrene oxide from styrene.
The multiloop beta-trapped enzyme
from *Pseudomonas cepacia* catalyzes
the direct conversion of styrene to
styrene oxide. The reactions proceed by
a multiloop mechanism, in which a key
intermediate is converted to the actual
enzyme/product complex. In order to
understand the mechanism of the
enzyme, the reaction was examined
with whole cells, purified wild-type
enzyme, and two variants: V84L and
M315I. The wild-type enzyme catalyzed
the synthesis of styrene oxide with a

maximum rate of 10 mol H₂O₂ per mol acetophenone oxidized per min. The V84L variant was found to be catalytically competent, but it showed more than 100-fold reduction in the specific activity of styrene oxidation. In contrast, the M315I variant behaved as a dead-end enzyme, with the specific activity of approximately 0.5 mol H₂O₂/mol oxidized acetophenone. Incubation of the enzyme with styrene during styrene epoxidation, in the absence of oxygen, did not enhance the catalytic efficiency of styrene epoxidation, indicating that oxygen is essential for the catalytic mechanism of this enzyme. In summary, the present study reveals that styrene oxide formation from styrene by the multiloop beta-trapped enzyme proceeds via a multiloop mechanism and requires oxygen for the catalytic activity. We conclude that oxygen is required to generate the putative reactive oxyiron-oxyl species, which oxidize the C6 carbon in the intermediate multiloop intermediate. Furthermore, we also

discuss the

Translating multiple IF-THEN statements into an 'AND' statement I'm translating some code using a word formula. This is all a good experience for me as I'm new

to Excel, but I can't get this to work. I know the issue is somewhere in the AND IF statement, but I'm not sure where. Would really appreciate some help!

A: The * indicates a wildcard for "any text" (for example, if you want to check whether anything is in the array, the formula will return TRUE as long as there is ANY text in the cell). So for this formula, TRUE will be returned as long as any of the cells (2,3,4,5) contain the word "ME" So, as an example of using the AND function: =AND(2="ME", 3="ME", 4="ME", 5="ME") You can also use: =AND(OR(2="ME", 3="ME", 4="ME", 5="ME"),)) for improving the efficiency of the layer-by-layer assembly process, for example coating the nanoparticle residues from the first layer by a second nanoparticle layer. The solvent, which dissolves at least one of the nanoparticles and/or prevents any further layer-by-layer assembly, or which is freely soluble in both the nanoparticles and in the polyelectrolytes (for example water or the like), is optionally separated from

the nanoparticles by simply filtration. The coating of the nanoparticles may occur before, or in a separate stage or step to, the layer-by-layer assembly, and optionally before or during the assembly of the first layer. The layer-by-layer assembly may be carried out in the solvent which is used for the coating of the nanoparticles. The polyelectrolyte may be a polyanion
